CLAIMS

 A method for controlling the drive of an actuator of an active vibration
isolation support system that includes an elastic body receiving a load from a
vibrating body, a liquid chamber having a wall of which at least a part is formed
from the elastic body, a movable member that moves out and back to change the
capacity of the liquid chamber in a cycle, and an actuator that receives a supply of
current to generate an electromagnetic force for moving the movable member out,
the method comprising the step of:

controlling the current supplied to the actuator such that the current passing through the actuator becomes zero at least when the movable member has moved back.

2. The method according to Claim 1, wherein it further comprises the steps of:

setting a large number of consecutive micro time regions in the cycle; and carrying out duty control of the voltage that is applied to the actuator in each of the micro time regions.
